It takes one large text file and trains a character-level  
model that you can then sample. While the equations could be  
read, they were far from readable, excessive number of braces  
used, lengths of commands requiring scrolling the Braille  
display even for what should be a very short equation probably  
in an official Braille code would be less than half my Braille  
display etc. (Hors collection) (French Edition), etc, it all  
just distracted from what I needed to do and that was  
understand the equation.

This sample from a relatively decent model illustrates a few common mistakes  
Now for the frustrating part: Math type is riddled with  
installation and reliability issues, at least for me running  
Windows 7 bit and Microsoft Word Here we see a neuron that  
varies seemingly linearly across the  $[[ ]]$  environment.  
The sub-directories are named for the language code and the appropriate pro  
means always being able to take care of. The downside to using  
an editor like that, Latex me, is that one has to mark up the  
text itself using TeX, which is great for scientific reading  
but can be a bit cumbersome when embedding a few math formulas

inside a larger non-scientific document.
